BRUT-24

We prioritized doing the tasks that appear first in each of the story breakdowns, so that we can quickly deliver functioning parts of app. We did not want to delay the latter tasks more than necessary.

For difficult tasks like 44 under BRUT-19, which also had two dependencies, the rest of the team made time to help Kyle and Ali implement the subtasks 42 and 43 so that they could move on to 44 and finish the entire feature by the end of sprint 2 on time.

For BRUT-2, BRUT-7 and subtask 33 depended on 31, since both branched out from 31. Even though they are different user stories, their interconnectivity in the network graph had us make the informed decision to assign them to the same person, Mark, to do to save time. Both stories are implemented with one file so Mark should be familiar with the code, thus completing both stories more quickly.

We did not have the time to finish BRUT-24 and had to remove it from this sprint. The reason being it had caused a large spike and would require lots of time to do the research in order to make any visible progress. We decided that we would spend more time on finishing the simpler tasks first.
